HC32L13x Series

32-bit ARM® Cortex® -M0+ Microcontroller

Datasheet

Rev2.13 March 2025

Features

- **48MHz Cortex-M0+ 32-bit CPU platform**
- **HC32L130/HC32L136 series has a flexible power management system, ultra-low power performance**
  - 0.5μA @ 3V Deep-sleep mode: all clocks off, power-on reset active, IO state retained, IO interrupt active, all registers, RAM and CPU data save state power consumption
  - 0.9μA @3V deep sleep mode + RTC working
  - 7μA @32.768kHz low-speed working mode: CPU and peripherals running, running programs from Flash
  - 35μA/MHz@3V@24MHz sleep mode: CPU stops, peripherals run, main clock runs
  - 130μA/MHz@3V@24MHz working mode: CPU and peripherals running, running programs from Flash
  - 4μs ultra-low power consumption wake-up time, making mode switching more flexible and efficient, and system response more agile
- 64K bytes Flash memory, with erase and write protection function
- 8K bytes RAM memory with parity check to enhance system stability
- General I/O pins (56IO/64pin, 40IO/48pin, 26IO/3 2pin, 23IO/28pin)
- Clock, crystal
  - External high-speed crystal oscillator 8 ~ 32MHz
  - External low-speed crystal 32.768kHz
  - Internal high-speed clock 4/8/16/22.12/24MHz
  - Internal low-speed clock 32.8/38.4kHz
  - PLL clock 8 ~ 48MHz
  - Hardware supports internal and external clock calibration and monitoring
- Timer/counter
  - Three 1- channel complementary general-purpose 16- bit timers
  - 1 x 3 -channel complementary output 16- bit timer
  - 1 low-power 16 -bit timer
  - 3 high-performance 16-bit timers/counters, support PWM complementary, dead zone protection function
  - 1 programmable 16-bit timer PCA, support capture compare, PWM output
  - 1 ultra-low-power pulse counter PCNT, with automatic timing wake-up function in low-power mode, the maximum timing is 1024 seconds
  - 1 20-bit programmable watchdog circuit, built-in dedicated 10kHz oscillator to provide WDT counting
- Communication Interface
  - 2-channel UART standard communication interface
  - 2-channel LPUART low power communication interface, can work in deep sleep mode
  - 2-channel SPI standard communication interface
  - 2-channel I2C standard communication interface
- Buzzer frequency generator, support complementary output
- Hardware perpetual calendar RTC module
- Hardware CRC-16/32 module
- Hardware 32-bit divider
- AES-128 hardware coprocessor
- TRNG true random number generator
- 2- channel DMAC
- 4*40 / 6*38 / 8*36 LCD driver
- Globally unique 10-byte ID number
- 12-bit 1Msps sampling high-speed and high-precision SARADC, built-in op amp, can measure external weak signals
- Integrates 3 multifunctional operational amplifiers
- 2- way VC with integrated 6 -bit DAC and programmable reference input
- Integrated low voltage detector, can be configured with 16-step comparison voltage, can monitor port voltage and power supply voltage
- SWD debugging solution, providing a full-featured debugger
- Working conditions: -40 ~ 85 ℃, 1.8 ~ 5.5V
- Encapsulation form: QFN32/48, LQFP64/48, TSSOP28

1 Introduction

The HC32L130/ HC32L136 series is an ultra-low power consumption, wide voltage operating range MCU designed to extend battery life in portable measurement systems. Integrated 12-bit 1Msps high-precision SARADC and integrated comparator, operational amplifier, built-in high-performance PWM timer, LCD display, multi-channel UART, SPI, I2C and other rich communication peripherals, built-in AES, TRNG and other information security modules, It has the characteristics of high integration, high anti-interference, high reliability and ultra-low power consumption. The core of this product adopts the Cortex-M0+ core, cooperates with mature Keil & IAR debugging and development software, supports C language, assembly language, and assembly instructions.

Ultra-low power MCU typical applications

- Sensor applications, IoT applications;
- Smart transportation, smart city, smart home;
- Fire alarm probes, smart door locks, wireless monitoring and other smart sensor applications;
- All kinds of portable devices that are battery-powered and power-hungry.

32-bit CORTEX M0+ core

The ARM® Cortex®-M0+ processor is derived from Cortex-M0 and includes a 32-bit RISC processor with a computing power of 0.95 Dhrystone MIPS/MHz. At the same time, a number of new designs have been added to improve debugging and tracing capabilities, reduce the number of each instruction cycle (IPC) and improve the two-stage pipeline for Flash access, and incorporate energy-saving and consumption-reducing technologies. The Cortex-M0+ processor fully supports the integrated Keil & IAR debugger.

Cortex-M0+ includes a hardware debugging circuit that supports 2-pin SWD debugging interface.

ARM Cortex-M0+ features:

Instruction Set	Thumb / Thumb-2
Assembly line	2-stage assembly line
Performance efficiency	2.46 CoreMark / MHz
Performance efficiency	0.95 DMIPS / MHz in Dhrystone
Interrupt	32 fast interrupts
Interrupt priority	Configurable 4-level interrupt priority
Enhanced instruction	Single-cycle 32-bit multiplier
Debugging	Serial-wire debug port, supports 4 hard interrupts (break points) and 2 watch points (watch points)

64K Byte Flash

The built-in fully integrated Flash controller does not require external high voltage input, and the high voltage is generated by the fully built-in circuit for programming. Support ISP, IAP, ICP functions.

8K Byte RAM

According to different ultra-low power modes selected by customers, RAM data will be retained. With hardware parity bit, in case the data is accidentally damaged, when the data is read, the hardware circuit will immediately generate an interrupt to ensure the reliability of the system.

Clock system

A high-precision internal clock RCH with a configurable frequency of 4-24MHz. Under the configuration of 24MHz, the wake-up time from low power consumption mode to working mode is 4us, and the frequency deviation within the full voltage and full temperature range is small, and it is not necessary to connect an expensive high-frequency crystal.

An external crystal oscillator XTH with a frequency of 8-32MHz.

An external crystal oscillator XTL with a frequency of 32.768kHz mainly provides the RTC real-time clock.

An internal clock RCL with a frequency of 32.768/38.4kHz.

A PLL with 8-48MHz output frequency.

Operating mode

1) Running mode Active: CPU running, peripheral function modules running.
2) Sleep mode Sleep: The CPU stops running, and the peripheral function modules run.
3) Deep sleep mode Deep sleep: The CPU stops running, the high-speed clock stops, and the low-power function modules run.

Real Time Clock RTC

RTC (Real Time Counter) is a register that supports BCD data. It uses a 32.768kHz crystal oscillator as its clock to realize the perpetual calendar function. The interrupt cycle can be configured as year/month/day/hour/minute/second. 24/12 hour time mode, the hardware automatically corrects leap years. With accuracy compensation function, the highest accuracy is 0.96ppm. Internal temperature sensor or external temperature sensor can be used for accuracy compensation, software +1/-1 can be used to adjust year/month/day/hour/minute/second, and the minimum adjustable accuracy is 1 second.

The RTC calendar recorder used to indicate the time and date will not clear the retained value when the MCU is reset due to external factors. It is the best choice for measuring equipment and meters that require a permanent high-precision real-time clock.

Port controller GPIO

It can provide up to 56 GPIO ports, some of which are multiplexed with analog ports. Each port is controlled by independent control register bits and supports FAST IO. Supports edge-triggered interrupts and level-triggered interrupts, and can wake up the MCU to working mode from various

ultra-low power consumption modes. Support position, clear, and clear operations. Support Push-Pull CMOS push-pull output, Open-Drain open-drain output. Built-in pull-up resistor, pull-down resistor, with Schmitt trigger input filter function. The output drive capability is configurable, and the maximum current drive capability is 20mA. 56 general-purpose IOs can support external asynchronous interrupts.

Interrupt Controller NVIC

The Cortex-M0+ processor has a built-in nested vectored interrupt controller (NVIC), which supports up to 32 interrupt request (IRQ) inputs; it has four interrupt priority levels, can handle complex logic, and can perform real-time control and interrupt processing.

The 32 interrupt entry vector addresses are:

Interrupt vector number	Interrupt source
[0]	GPIO_PA
[1]	GPIO_PB
[2]	GPIO_PC
[3]	GPIO_PD

Reset controller RESET

This product has 7 reset signal sources, each reset signal can make the CPU run again, most of the registers will be reset, and the program counter PC will be reset to point to 00000000.

	Reset source
[0]	Power-on and power-down reset POR BOR
[1]	External Reset Pin reset
[2]	WDT reset
[3]	PCA reset
[4]	Cortex-M0+ LOCKUP hardware reset
[5]	Cortex-M0+ SYSRESETREQ software reset
[6]	LVD reset

DMA controller DMAC

The DMAC (Direct Memory Access Controller) function block can transmit data at high speed without passing through the CPU. Using DMAC can improve system performance.

Timer TIM

Types of	Name	Bit width	Prescaler	Counting direction	PWM	capture	Complementary output
Universal timer	TIM0	16/32	1/2/4/8/16 32/64/256	Up count/ Count down/ Up and down count	2	2	1

	TIM3	16/32	1/2/4/8/16/ 32/64/256	Up count/ Count down/	6	6	3

Types of	Name	Bit width	Prescaler	Counting direction	PWM	capture	Complementary output
				Up and down count			
Low power timer	LPTIM	16	无	Up count	No	No	No
Programmable counting array	PCA	16	2/4/8/16/32	Up count	5	5	No
Advanced timer	TIM4	16	1/2/4/8/16/ 64/256/1024	Up count/ Count down/ Up and down count	2	2	1
	TIM5	16	1/2/4/8/16/ 64/256/1024	Up count/ Count down/ Up and down count	2	2	1
	TIM6	16	1/2/4/8/16/ 64/256/1024	Up count/ Count down/ Up and down count	2	2	1

The general timer includes four timers TIM0/1/2/3.

General timer features:

- PWM independent output, complementary output
- Capture input
- Dead zone control
- Brake control
- Edge alignment, symmetric center alignment and asymmetric center alignment PWM output
- Quadrature code counting function
- Single pulse mode
- External counting function

TIM0/1/2 have exactly the same function. TIM0/1/2 is a synchronous timer/counter, which can be used as a 16-bit timer/counter with automatic reloading function, or as a 32-bit timer/counter without reloading function. Each timer of TIM0/1/2 has 2 channels of capture and comparison function, which can generate 2 channels of independent PWM output or 1 group of complementary PWM outputs. With dead zone control function.

TIM3 is a multi-channel general-purpose timer with all the functions of TIM0/1/2. It can generate 3 sets of PWM complementary outputs or 6 channels of PWM independent output, and a maximum of 6 channels of input capture. With dead zone control function.

The low-power timer LPTIM is an asynchronous 16-bit timer/counter. After the system clock is turned off, it can still clock/count through the internal low-speed RC or external low-speed crystal oscillator. Wake up the system in low-power mode through interrupts.

PCA (Programmable Counter Array) supports up to 5 16-bit capture/compare modules. The timer/counter can be used as a common clock count/event counter capture/compare function. Each

module of PCA can be independently programmed to provide input capture, output comparison or pulse width modulation. In addition, module 4 has an additional watchdog timer mode.

Advanced Timer Advanced Timer contains three timers TIM4/5/6. TIM4/5/6 is a high-performance counter with the same function, which can be used to count and generate different forms of clock waveforms. One timer can generate a complementary pair of PWM or independent 2- way PWM output, which can capture external input for pulse width or Period measurement.

The basic functions and features of Advanced Timer are shown in the table:

Waveform mode	Sawtooth wave, triangular wave
Basic functions	• Direction of increments and decrements
	• Software synchronization
	• Hardware synchronization
	• Cache function
	• Orthogonal coding count
	• General PWM output
	• Protection mechanism
	• AOS related actions
Interrupt type	Count comparison match interrupt
	Count cycle match interrupt
	Dead time error interrupt

Pulse counter PCNT

The PCNT (Pulse Counter) module is used to count external pulses and supports single-channel and dual-channel (quadrature code and non-interleaved code) pulses. It can count in low-power sleep mode without software involvement.

Pulse counter characteristics:

- 16-bit counter supporting reload function
- Single channel pulse count
- Dual channel non-intersecting pulse counting
- Two-channel quadrature pulse counting without missing codes
- Up/down counting overflow interrupt
- Pulse timeout interrupt
- 4 kinds of decoding error interrupt, non-intermittent pulse mode
- 1 direction change interrupt, quadrature pulse mode
- Multi-stage pulse width filtering
- Configurable input pulse polarity
- Support low-power mode counting

- Support waking up MCU in low power mode
- Support any pulse edge spacing not less than 1 count clock cycle
- With automatic timing wake-up function in low power consumption mode, the maximum timing is 1024 seconds

Watchdog WDT

WDT (Watch Dog Timer) is a configurable 20-bit timer that provides reset in the case of MCU abnormality; built-in 10kHz low-speed clock input is used as the counter clock. In debug mode, you can choose to pause or continue to run; WDT can only be restarted by writing a specific sequence.

Universal synchronous asynchronous transceiver UART0~UART1

2-channel universal synchronous asynchronous receiver/transmitter (Universal Asynchronous Receiver/Transmitter), UART0/UART1.

Basic functions of universal UART:

- Half-duplex and full-duplex transmission
- 8/9-Bit transmission data length
- Hardware parity
- 1/1.5/2-Bit stop bit
- Four different transmission modes
- 16-Bit baud rate counter
- Multi-machine communication
- Hardware address recognition
- DMAC hardware transmission handshake
- Hardware flow control

Low power synchronous asynchronous transceiver LPUART0~LPUART1

2-channel synchronous asynchronous transceiver (Low Power Universal Asynchronous Receiver/Transmitter) that can work in low power consumption mode, LPUART0/LPUART1.

Basic functions of LPUART:

- Transmission clock SCLK (SCLK can choose XTL, RCL and PCLK)
- Send and receive data in system low power mode
- Half-duplex and full-duplex transmission
- 8/9-Bit transmission data length
- Hardware parity
- 1/1.5/2-Bit stop bit
- Four different transmission modes

- 16-Bit baud rate counter
- Multi-machine communication
- Hardware address recognition
- DMAC hardware transmission handshake
- Hardware flow control

Serial Peripheral Interface SPI

2-channel synchronous serial interface (Serial Peripheral Interface).

Basic characteristics of SPI:

- Can be configured as master or slave through programming
- Four-wire transmission mode, full duplex communication
- Host mode 7 kinds of baud rate configurable
- The maximum frequency division factor of the host mode is PCLK/2, and the maximum communication rate is 16M bps
- The maximum frequency division factor of slave mode is PCLK/8, and the maximum communication rate is 6M bps
- Configurable serial clock polarity and phase
- Support interrupt
- 8-bit data transmission, first transmit high bit and then low bit
- Support DMA software/hardware access

I2C bus

Two-way I2C, using serial synchronous clock, can realize data transmission between devices at different rates.

Basic characteristics of I2C:

- Support four working modes of master sending/receiving and slave sending/receiving
- Support standard (100Kbps) / fast (400Kbps) / high speed (1Mbps) three working rates
- Support 7-bit addressing function
- Support noise filtering function
- Support broadcast address
- Support interrupt status query function

Buzzer

4 general-purpose timers and 1 low-power timers function multiplexing output to provide programmable driving frequency for Buzzer. The buzzer port can provide 20mA sink current, complementary output, no additional transistor is needed.

Clock calibration circuit module CLKTRIM

The built-in clock calibration circuit can calibrate the internal RC clock through an external precise crystal oscillator clock, and can also use the internal RC clock to check whether the external crystal oscillator clock is working properly.

Basic features of clock calibration:

- Calibration mode
- Monitoring mode
- 32-bit reference clock counter can be loaded with initial value
- 32-bit clock counter to be calibrated with configurable overflow value
- 6 reference clock sources
- 5 clock sources to be calibrated
- Support interrupt mode

Device electronic signature

Each chip has a unique 10-byte device identification number before leaving the factory, including wafer lot information and chip coordinate information. The UID addresses are: 0X00100E74 - 0X00100E7D.

Cyclic Redundancy Check (CRC)

CRC16 conforms to the polynomial given in ISO/IEC13239 $=X^{16} + X^{12} + X^5 + 1$

CRC32 conforms to the polynomial given in ISO/IEC13239 $= x^{32}+x^{26}+x^{23}+x^{22}+x^{16}+x^{12}+x^{11}+x^{10}+x^8 +x^7 +x^5 +x^4+x^2 +x+1$

Hardware dividerModule HDIV

HDIV (Hardware Divider) is a 32-bit signed/unsigned integer hardware divider.

Basic characteristics of HDIV hardware divider:

- Configurable signed/unsigned integer division calculation
- 32-bit dividend, 16-bit divisor

- Output 32-bit quotient and 32-bit remainder
- Divide by zero warning flag, division end flag
- 10 clock cycles to complete a division operation
- Write the divisor register to trigger the start of the division operation
- Automatically wait for the end of the calculation when reading the quotient register/remainder register

Advanced Encryption StandardModule AES

AES (The Advanced Encryption Standard) is a new data encryption standard officially announced by the National Institute of Standards and Technology (NIST) on October 2, 2000. The block length of AES is fixed at 128 Bit, and the key length supports 128 Bit.

True random number generator TRNG

TRNG is a true random number generator, used to generate true random numbers.

Analog-to-digital converter ADC

A 12-bit successive approximation analog-to-digital converter with monotonous and no missing codes, when working under a 24MHz ADC clock, the sampling rate reaches 1Msps. The reference voltage can be selected from the on-chip precision voltage (1.5V or 2.5V) or from an external input or power supply voltage. 29 input channels, including 24 external pin inputs, 1 internal temperature sensor voltage, 1/3 supply voltage, and 3 OPA outputs. Built-in configurable input signal amplifier to detect weak signals.

Basic characteristics of SAR ADC:

- 12-bit conversion accuracy;
- 1Msps conversion speed;
- 29 input channels, including 24 external pin inputs, 1 internal temperature sensor voltage, 1 1/3 AVCC voltage, and 3 OPA outputs;
- 4 reference sources: AVCC voltage, ExRef pin, built-in 1.5V reference voltage, built-in 2.5V reference voltage;
- ADC voltage input range: 0~Vref;
- 4 conversion modes: single conversion, sequential scan continuous conversion, queue scanning continuous conversion, continuous conversion accumulation;
- Input channel voltage threshold monitoring;
- Software can configure ADC conversion rate;
- Built-in signal amplifier, can convert high impedance signal;

- Support on-chip peripherals to automatically trigger ADC conversion, effectively reducing chip power consumption and improving real-time conversion.

Analog Voltage Comparator VC

Chip pin voltage monitoring / comparison circuit. 16 configurable positive external input channels, 11 configurable negative external input channels; 4 internal negative input channels, including 1 internal temperature sensor voltage, 1 -channel built-in BGR 2.5V reference voltage, 1 channel 64-step resistor divider. VC output can be used for general-purpose timer TIM0/1/2/3, low-power timer LPTIM and programmable counting array PCA for capturing, gating, and external counting clock. An asynchronous interrupt can be generated according to the rising/falling edge to wake up the MCU from the low-power mode. Configurable software anti-shake function.

Low voltage detector LVD

Detect the chip power supply voltage or chip pin voltage. 16-shift voltage monitoring values (1.8 - 3.3V). An asynchronous interrupt or reset can be generated based on the rising/falling edge. With hardware hysteresis circuit and configurable software anti-shake function.

LVD basic characteristics:

- 4 -channel monitoring sources, AVCC, PC13, PB08, PB07;
- 16-stage threshold voltage, 1.8-3.3V optional;
- 8 trigger conditions, combinations of high level, rising edge and falling edge;
- 2 trigger results, reset and interrupt;
- 8-stage filter configuration to prevent false triggering;
- With hysteresis function, strong anti-interference.

Operational Amplifier OPA

OPA module can be flexibly configured and is suitable for simple filter and buffer applications. The three internal op amps can be configured as combined op amps with different gains in the opposite direction and in the same direction, or can be cascaded with external resistors.

LCD controller LCD

LCD controller is a digital controller/driver suitable for monochrome passive liquid crystal displays (LCD), with up to 8 common terminals (COM) and 40 segment terminals (SEG) to drive 160 (4x40) Or 288 (8x36) LCD image elements. You can choose either capacitor voltage divider or resistor

voltage divider to support internal resistor divider. The internal resistance divider can adjust the contrast. Support DMA hardware data transfer.

Basic characteristics of LCD:

- Highly flexible frame rate control.
- Support static, 1/2, 1/3, 1/4, 1/6 and 1/8 duty cycle.
- Support 1/2, 1/3 offset.
- LCD data RAM with up to 16 registers.
- The contrast of LCD can be configured through software.
- Three drive waveform generation methods.
  - Internal resistor divider, external resistor divider, external capacitor divider method
  - The power consumption of the internal resistor divider method can be configured through software to match the capacitive charge required by the LCD panel
- Support low power mode: LCD controller can display in Active, Sleep, DeepSleep mode.
- Configurable frame interrupt.
- Support LCD blinking function and configurable multiple blinking frequencies
- The unused LCD segments and common pins can be configured as digital or analog functions.

Embedded debugging system

Embedded debugging solution, providing a full-featured real-time debugger, with standard mature Keil/IAR and other debugging and development software. Support 4 hard breakpoints and multiple soft breakpoints.

Programming mode

Two programming modes are supported: online programming and offline programming.

Support two programming protocols: ISP protocol, SWD protocol.

ISP protocol programming interface: PA9, PA10 or PA13, PA14.

SWD protocol programming interface: PA13, PA14.

When reset, BOOT0 (PD03) pin is high level, the chip works in ISP programming mode, and Flash can be programmed through ISP protocol.

When reset, BOOT0 (PD03) pin is low level, the chip works in user mode, the chip executes the program code in Flash, and Flash can be programmed through SWD protocol.

Note:

– It is recommended to reserve PA9 and PA10 as the ISP programming interface. If you need to use PA13 and PA14 as the ISP programming interface, please refer to PCN: PCN20191230-1_HC32L130HC32F030HC32L136 to increase the programming speed.

High security

Encrypted embedded debugging solution, providing a full-featured real-time debugger.

Note:

- AVCC and DVCC voltage must be the same.
- Each group of power supplies requires a decoupling capacitor, and the decoupling capacitor should be as close as possible to the corresponding power supply pin.

7 Electrical characteristics

7.1 Test Conditions

All voltages are referenced to VSS unless otherwise noted.

7.1.1 Minimum and maximum values

Unless otherwise specified, all minimum and maximum values will be in the worst environment through the test performed on 100% of the products in the production line at ambient temperature T_A=25℃ and T_A=$T_A$max ($T_A$max matches the selected temperature range) Guaranteed over temperature, supply voltage, and clock frequency.

The notes at the bottom of each table indicate data obtained through comprehensive evaluation, design simulation and/or process characteristics, and will not be tested on the production line; on the basis of comprehensive evaluation, the minimum and maximum values are after sample testing. Take the average value and add or subtract three times the standard distribution (mean ± 3Σ).

7.1.2 Typical value

Unless otherwise specified, typical data is based on T_A=25℃ and VCC=3.3V (1.8V ≤ VCC ≤ 5.5V voltage range). These data are only used for design guidance and not tested.

The typical ADC accuracy value is obtained by sampling a standard batch and testing under all temperature ranges. The error of 95% of the products is less than or equal to the given value (average ± 2Σ).

7.2 Absolute maximum ratings

If the load on the device exceeds the value given in the "Absolute Maximum Ratings" list, it may cause permanent damage to the device. This only gives the maximum load that can be withstood, and does not mean that the functional operation of the device under this condition is correct. Long-term operation of the device under the maximum condition will affect the reliability of the device.

Table 7-1 Voltage Characteristics

Symbol	Description	Minimum Value	Maximum Value	Unit
VCC - VSS	External main supply voltage (includes AVCC and DVCC)(1)	-0.3	5.5	V
V_{IN}	Input voltage on other pins(2)	VSS-0.3	VCC + 0.3	V
| ΔVCCx |	Voltage difference between different power supply pins		50	mV
| VSSx - VSS |	Voltage difference between different ground pins		50	mV
V_{ESD}(HBM)	ESD electrostatic discharge voltage (human body model)	Refer to absolute maximum electrical parameters		V

1. All power (DVCC, AVCC) and ground (DVSS, AVSS) pins must always be connected to an external power supply within the allowable range.
2. $I_{INJ(PIN)}$ must not exceed its limit, which means that V_{IN} does not exceed its maximum value. If it cannot be guaranteed that V_{IN} does not exceed its maximum value, it is also necessary to ensure that the external limit $I_{INJ(PIN)}$ does not exceed its maximum value. When $V_{IN}>V_{CC}$, there is a forward injection current; when $V_{IN}<V_{SS}$, there is a reverse injection current.

Table 7-2 Voltage Characteristics

Symbol	Description	Max (1)	Unit
I_{VCC}	The total current (supply current) through the DVCC/AVCC power cord (1)	300	mA
I_{VSS}	The total current through the VSS ground wire (outflow current) (1)	300	mA
I_{IO}	Output sink current on any I/O and control pin	25	mA
	Output current on any I/O and control pin	-25	mA
$I_{INJ(PIN)}$(2) (3)	Injection current of RESETB pin	+/-5	mA
	Injection current of XTHI pin of XTH and XTLI pin of XTL	+/-5	mA
	Injection current of other pins (4)	+/-5	mA
$\sum I_{INJ(PIN)}$ (2)	Total injection current on all I/O and control pins (4)	+/-25	mA

1. All power (DVCC, AVCC) and ground (DVSS, AVSS) pins must always be connected to an external power supply within the allowable range.
2. $I_{INJ(PIN)}$ must not exceed its limit, which means that V_{IN} does not exceed its maximum value. If it cannot be guaranteed that V_{IN} does not exceed its maximum value, it is also necessary to ensure that the external limit $I_{INJ(PIN)}$ does not exceed its maximum value. When $V_{IN}>V_{CC}$, there is a forward injection current; when $V_{IN}<V_{SS}$, there is a reverse injection current.
3. The reverse injection current will interfere with the analog performance of the device.
4. When several I/O ports have injection current at the same time, the maximum value of $\sum I_{INJ(PIN)}$ is the sum of the

instantaneous absolute value of the forward injection current and the reverse injection current. This result is based on the characteristics of the maximum $\Sigma I_{INJ(PIN)}$ on the 4 I/O ports of the device.

DVCC	Working voltage of digital part		1.8	5.5	V
AVCC(1)	Analog part working voltage	Must be the same as DVCC(2)	1.8	5.5	V
P_D	Power dissipation T_A=85℃	LQFP64		455	mW
	Power dissipation T_A=85℃	LQFP48		364	mW
	Power dissipation T_A=85℃	LQFP32		357	mW
	Power dissipation T_A=85℃	TSSOP28		283	mW
T_A	Ambient temperature	Maximum power consumption	-40	85	℃
		Low power consumption (3)	-40	105	℃
T_J	Junction temperature range		-40	105	℃

1. When using an ADC, see ADC Electrical Specifications.
2. It is recommended to use the same power supply for DVCC and AVCC, allowing a maximum of 300mV difference between DVCC and AVCC during power-up and normal operation.
3. In a state of lower power dissipation, as long as T_J does not exceed T_{Jmax} , T_A can be extended to this range.

7.3.5 Supply Current characteristics

Current consumption is a comprehensive index of multiple parameters and factors. These parameters and factors include operating voltage, ambient temperature, I/O pin load, product software configuration, operating frequency, I/O pin flip rate, and program in memory The location in and executed code, etc.

The microcontroller is in the following conditions:

- All I/O pins are in input mode and connected to a static level-VCC or VSS (no load).
- All peripherals are turned off, unless otherwise specified.
- The access time of the flash memory is adjusted to the frequency of f_{HCLK} (0 wait cycle for 0~24MHz, 1 wait cycle for 24~48MHz).
- When the peripheral is turned on: $f_{PCLK0} = f_{HCLK}$, $f_{PCLK1} = f_{HCLK}$.

7.3.6 Time to wake up from low power mode

The wake-up time is measured during the wake-up phase of the RCH oscillator. The clock source used when waking up depends on the current operating mode:

- Sleep mode: clock source is RCH oscillator
- RCH oscillator when entering deep sleep

Symbol	Papameter	Conditions	Min	Typ	Max	Unit
T_{wu}	Sleep mode wake-up time			1.8		μs
	Deep sleep wake-up time	F_{MCLK} = 4MHz		9.0		μs
		F_{MCLK} = 8MHz		6.0		μs
		F_{MCLK} = 16MHz		5.0		μs
		F_{MCLK} = 24MHz		4.0		μs

1. The wake-up time is measured from the start of the wake-up event to the user program reading the first instruction.

7.3.7.3 High-speed external clock XTH

The high-speed external clock (XTH) can be generated using a 8-32MHz crystal/ceramic resonator oscillator. The information given in this section is based on the results obtained through comprehensive characteristic evaluation using the typical external components listed in the table below. In the application, the resonator and load capacitor must be as close as possible to the oscillator pin to reduce output distortion and settling time at startup. For detailed parameters (frequency, packaging, accuracy, etc.) of the crystal resonator, please consult the corresponding manufacturer.

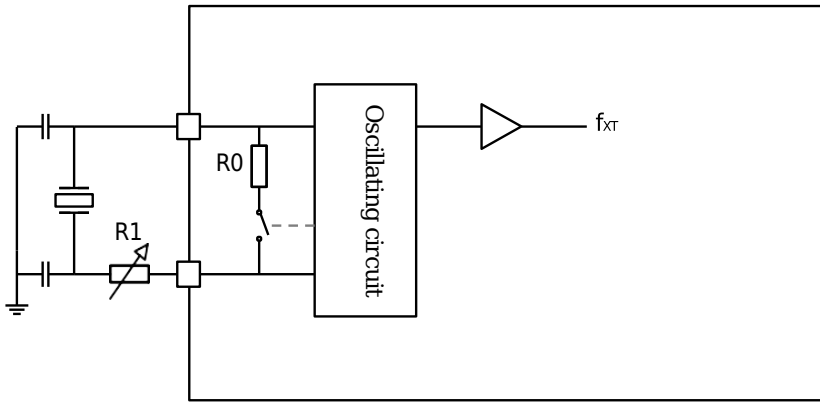
1. The characteristic parameters of the resonator are provided by the crystal/ceramic resonator manufacturer.
2. According to comprehensive evaluation, it is not tested in production.
3. CLX refers to the two pin load capacitors CL1 and CL2of XTAL. For CL1 and CL2, it is recommended to use high-quality ceramic capacitors designed for high-frequency applications and select crystals or resonators that meet the requirements. Usually, CL1and CL2have the same parameters. Crystal manufacturers typically provide the parameters of load capacitance in a serial combination of CL1and CL2. When selecting CL1and CL2, the frequency and ESR parameters of the crystal oscillator should be taken into account, and the capacitance impedance of the PCB and MCU pins should be taken into account.
4. The current varies with the choice of frequency and driving capability. The higher the frequency, the stronger the driving ability, and the greater the current consumption..
5. Tstart is the startup time, which is measured from the software enabling XTH until a stable oscillation of 32MHz/8MHz is obtained. This value was measured using a standard crystal resonator with XTH_CR [5:4]=0b10 setting, and it may vary greatly depending on the crystal manufacturer and model.



Note：

- *It is recommended to configure the matching capacitance of the crystal according to the requirements of the crystal manufacturer's technical manual.*
- *If the crystal manufacturer provides the capacitance value of the load capacitor, the capacitance value of the matching capacitor should be twice the capacitance value of the load capacitor provided by the crystal manufacturer. If the crystal manufacturer provides the capacitance value of the matching capacitor, then the capacitance value of the matching capacitor provided by the crystal manufacturer can be directly used.*
- *The chip has integrated feedback resistor R0.*
- *Damping resistor R1 is optional, and the value of the resistance depends on the crystal characteristics, with a default value of 0 Ω。*

7.3.7.4 Low-speed external clock XTL

The low-speed external clock (XTH) can be generated using a 32.768MHz crystal/ceramic resonator oscillator. The information given in this section is based on the results obtained through comprehensive characteristic evaluation using the typical external components listed in the table below. In the application, the resonator and load capacitor must be as close as possible to the oscillator pin to reduce output distortion and settling time at startup. For detailed parameters (frequency, packaging, accuracy, etc.) of the crystal resonator, please consult the corresponding manufacturer.

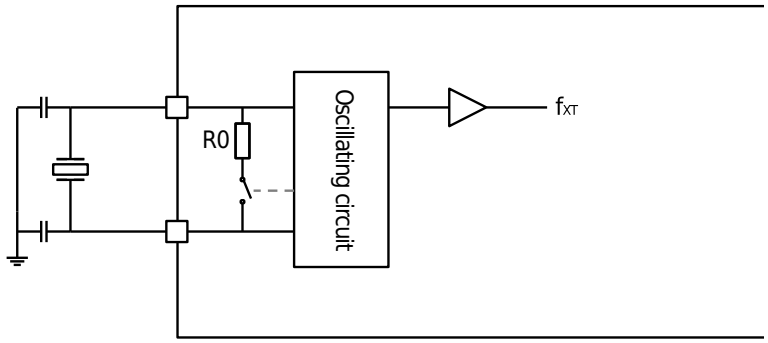
T_{start}(4)	Start time	ESR=30kΩ C_L=12pF XTL_CR[3:0]=0b1010	-	2000	-	ms

1. Based on comprehensive evaluation, it is determined that testing will not be conducted during production。
2. CLX refers to the load capacitance of the two pins of XTAL. Users suggest selecting the capacitance value of this capacitor according to the requirements of the crystal manufacturer.
3. If the crystal manufacturer provides the capacitance value of the load capacitor, the capacitance value of

the matching capacitor should be twice the capacitance value of the load capacitor provided by the crystal manufacturer. If the crystal manufacturer provides the capacitance value of the matching capacitor, then the capacitance value of the matching capacitor provided by the crystal manufacturer can be directly used。

4. Example：
5. When the crystal manufacturer provides a load capacitance of 8pF for the crystal, the capacitance value of the matching capacitor should be 16pF. Considering the distributed capacitance between PCB and MCU pins, it is recommended to choose matching capacitors with capacitance values of 15pF or 12pF.
6. When the crystal manufacturer provides a matching capacitance of 12pF for the crystal, the capacitance value of the matching capacitance should be 12pF. Considering the distributed capacitance between PCB and MCU pins, it is recommended to choose matching capacitors with capacitance values of 10pF or 8pF.
7. Choosing a high-quality oscillator with a smaller ESR value (such as MSIV-TIN32.768kHz) can optimize current consumption by adjusting the XTL_CR [3:0] setting. The current consumption is proportional to the transconductance gm) provided by the circuit。
8. Tstart is the startup time, which is measured from the software enabling XTL until a stable 32768Hz oscillation is obtained. This value was measured using a standard crystal resonator with XTL_CR [3:0]=0b1010 and XTL_CR [5:4]=0b11 settings, and it may vary greatly depending on the crystal manufacturer and model。



Note：

- *It is recommended to configure the matching capacitance of the crystal according to the requirements of the crystal manufacturer's technical manual.*
- *If the crystal manufacturer provides the capacitance value of the load capacitor, the capacitance value of the matching capacitor should be twice the capacitance value of the load capacitor provided by the crystal manufacturer. If the crystal manufacturer provides the capacitance value of the matching capacitor, then the capacitance value of the matching capacitor provided by the crystal manufacturer can be directly used.*
- *The chip has integrated feedback resistor R0.*

7.3.11 EFT Characteristic

A chip reset can restore the system to normal operation.

Symbol	Level/Type
EFT to IO (IEC61000-4-4)	Class:4A
EFT to Power (IEC61000-4-4)	Class:2A（4B）

Software recommendations

The software process must include control to deal with program runaway, such as:

- Corrupted program counter
- Unexpected reset
- Critical data is destroyed (control registers, etc.)

During the EFT test, interference that exceeds the application requirements can be directly applied to the chip power supply or IO. When an unexpected action is detected, the software part is strengthened to prevent unrecoverable errors.

7.3.12 ESD Characteristic

Using specific measurement methods, the chip is subjected to strength testing to determine its electrical sensitivity performance.

Symbol	Parameter	Conditions	Minimum Value	Typical Value	Maximum Value	Unit

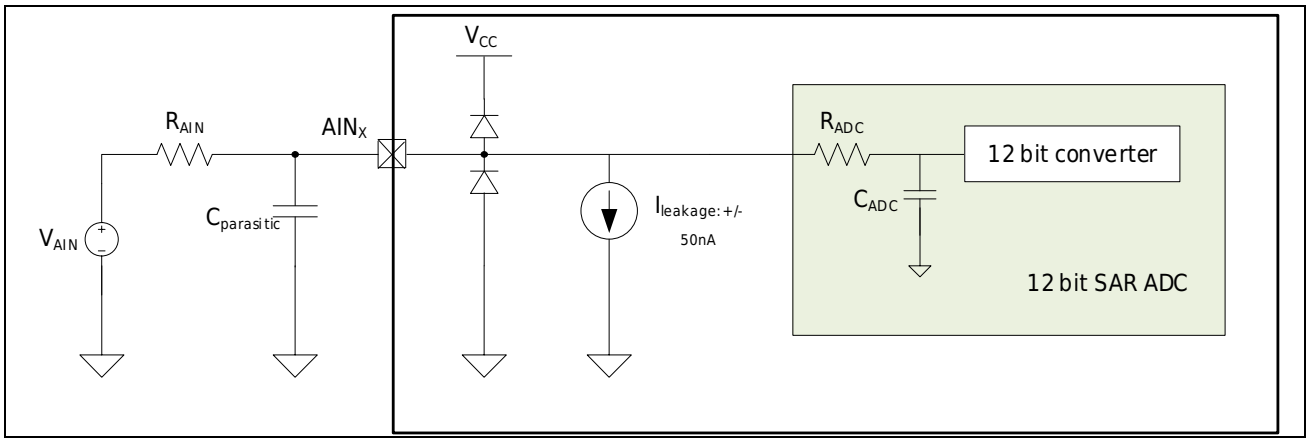
E_o	Offset error			0		LSB
E_g	Gain error			0		LSB

1. Guaranteed by design, not tested in production.
2. The typical application of ADC is shown in the figure below:



Under the condition of 0.5LSB sampling error accuracy requirement, the calculation formula of external input impedance is as follows:

$$R_{AIN} = \frac{M}{F_{ADC} * C_{ADC} * (N+1) * \ln(2)} - R_{ADC}$$

Among them F_{ADC} is the ADC clock frequency, the register ADC_CR0<3:2> can set the relationship between it and PCLK, as shown in the following table:

The following table shows the ADC clock frequency F_{ADC} Relationship with PCLK frequency division ratio:

ADC_CR0<3:2>	**N**
00	1
01	2
10	4
11	8

M is the number of sampling periods, which is set by the register ADC_CR0<13:12>.

The following table shows the relationship between sampling time t_{sa} and ADC clock frequency F_{ADC}:

ADC_CR0<13:12>	**M**
00	4
01	6
10	8
11	12

The following table shows the relationship between ADC clock frequency F_{ADC} and external resistance R_{AIN} (M=12, under the condition of sampling error 0.5LSB):

R_{AIN} **(kΩ)**	F_{ADC}**(kHz)**
10	5600
30	2100
50	1300
80	820
100	660
120	550
150	450

For the above typical applications, you should pay attention to:

- Minimize the ADC input port AIN_X parasitic capacitance $C_{PARACITIC}$;
- In addition to considering R_{AIN} the value, if the internal resistance of the signal source V_{AIN} is large, it also needs to be considered.

8.4 Packaging Thermal Resistance Coefficient

When the packaged chip is working at the specified working environment temperature, the junction temperature T_j (℃) of the chip surface can be calculated according to the following formula:

$$T_j = T_{amb} + (P_D \times \theta_{JA})$$

- T_{amb} refers to the working environment temperature when the packaged chip is working, the unit is ℃;
- θ_{JA} refers to the thermal resistance coefficient of the package to the working environment, the unit is ℃/W;
- P_D is equal to the sum of internal power consumption of the chip and I/O power consumption, and the unit is W. The internal power consumption of the chip is the product's I_{DD} x V_{DD} . I/O power consumption refers to the power consumption generated by the I/O pins when the chip is working. Usually this part of the value is very small and can be ignored.

When the chip is working at the specified working environment temperature, the junction temperature T_j of the chip surface cannot exceed the maximum allowable junction temperature T_J of the chip.

Table 8-1 Thermal resistance coefficient table for each package

Package Type and Size	Thermal Resistance Junction-ambient Value (θ_{JA})	Unit
LQFP64 10mm x 10mm / 0.5mm pitch	65 +/- 10%	℃/W
LQFP64 7mm x 7mm / 0.4mm pitch	75 +/- 10%	℃/W
LQFP48 7mm x 7mm / 0.5mm pitch	75 +/- 10%	℃/W
QFN48 7mm x 7mm / 0.5mm pitch	30 +/- 10%	℃/W
QFN32 4mm x 4mm / 0.4mm pitch	53 +/- 10%	℃/W
TSSOP28	64 +/- 10%	℃/W

Version revision history

Version number	Revision date	Modify the content
Rev1.00	2018/08/20	First edition release.
Rev1.10	2018/10/16	① The unique ID number is corrected to 10 bytes; ② Update the function table in the "Product Lineup"; ③ Revise the characteristic parameters of the RESETB pin.
Rev1.20	2019/02/27	① ADC characteristics; ② QFN32 package size; ③ Add silk screen description; ④ Delete product selection table, add ordering information; ⑤ Update product name; ⑥ Add NOTE to package size; ⑦ ESD characteristics;⑧ The minimum value of ECFlash in memory characteristics.
Rev1.30	2019/07/16	① Programming mode; ② ESD characteristics; ③ Ordering information; ④ Memory characteristics.
Rev1.40	2019/12/12	① BOOT0 pin in the pin configuration diagram; ② New descriptions are added in the module signal description; ③ Typical application circuit diagram; ④ Diagrams and precautions in the high-speed external clock XTH and low-speed external clock XTL .
Rev1.50	2020/01/17	① Silkscreen description; ② Add QFN48 package.
Rev1.60	2020/03/05	Added notes to "Programming Mode" in the introduction.
Rev1.70	2020/04/30	① Add AVCC/3 accuracy in ADC characteristics; ② Correct typos in 7.3.7; ③ I_{LCD} in LCD controller; ④ RCL oscillator accuracy in internal RCL oscillator.
Rev1.80	2020/07/31	① Input characteristics - the minimum value of VIH and the maximum value of VIL in ports PA, PB, PC, and PD; ② Add 7.3.19 and 7.3.20; ③ Add the schematic diagram of the pad and the thermal resistance coefficient of the package; ④ 7.3.11 level.
Rev1.90	2020/09/30	① Clock system description in the introduction; ② RCH oscillator accuracy in 7.3.8; ③ V_{IL} and V_{IH} in 7.3.14; ④ Add HC32L130J8UA-QFN48TR in the order information; ⑤ Add SPI features.
Rev2.00	2021/05/31	① Modify statement; ② I2C characteristics $t_{HD.STA}$ and $t_{SU.STO}$ parameters; ③ Serial Peripheral Interface SPI in Introduction; ④ Data retention period in memory characteristics; ⑤ Add g_m parameter in external clock source characteristics.
Rev2.10	2022/03/09	The company logo is updated.
Rev2.11	2024/05/30	① The number of ADC and VC channels in Chapter 1, deletion of 1.2V related descriptions, and deletion of 1.2V related descriptions in Table 7.3.16; ② Modify the storage temperature range in Table 7-3 temperature characteristics; ③ Add a section on "7.3.8.3 Internal Low Speed Clock 10k Oscillator".
Rev2.12	2024/12/12	① Update the content of chapters "7.3.7.3 High speed External Clock XTH" and "7.3.7.4 Low speed External Clock XTL".
Rev2.13	2025/03/28	①Update the relevant parameters of the SPI interface features in Table 7-16; ②Modify the maximum value of the input filter pulse and the minimum value of the input non-filtered pulse in Section 7.3.14 RESETB pin characteristics.
